

Ornate Christmas Lighting

Website Operations Guide — For Owners & AI Assistants

Overview

This guide explains every platform used to run the Ornate Christmas Lighting website, how they connect, and step-by-step instructions for making changes. It is written so both humans and AI assistants (like Claude) can understand the full picture and perform updates correctly.

Platform Summary

GitHub

Location: github.com/daledonovan/ornate-christmas-lighting

Stores all website source code. Every change must be committed and pushed here.

Vercel

Location: vercel.com — Project: site

Hosts and serves the live website. Auto-deploys when GitHub master branch is updated.

Supabase

Location: supabase.com — Project: ebhwujdnrumixcbxaiqv

Handles admin login authentication and database needs.

Antigravity

Location: VS Code Extension

The tool that made the first deployment to Vercel. No longer needed now that GitHub is connected.

Claude Code

Location: VS Code Extension by Anthropic

AI assistant used to make code changes, deploy, and manage the site.

Vercel MCP

Location: Configured in `.mcp.json` in project root

Gives Claude Code direct access to the Vercel API for deployments and management.

How Everything Connects

The workflow is: **Edit code locally** → **Commit to GitHub** → **Vercel auto-deploys** → **Live site updates**.

1. All website files live in: `C:\Users\daled\Ornate Christmas Lighting\site\`
2. Changes are made locally in VS Code using Claude Code.
3. Changes are committed and pushed to GitHub (master branch).

4. Vercel detects the push and automatically deploys the new version.
5. The live site at `site-theta-hazel.vercel.app` updates within ~60 seconds.

Making Changes Using Claude Code (AI)

Step 1 — Open VS Code and open the project folder:

```
C:\Users\daled\Ornate Christmas Lighting
```

Step 2 — Open the Claude Code panel in the sidebar.

Step 3 — Describe the change you want in plain English. Examples:

```
"Make the hero text larger"
```

```
"Change the phone number to (203) 555-1234"
```

```
"Add a new service called Rooftop Lighting to the services page"
```

Step 4 — Claude will edit the files and show you a preview of changes.

Step 5 — Claude commits and pushes to GitHub. Vercel deploys automatically.

Important: If a deployment does not appear on Vercel after a push, tell Claude to deploy directly. Claude will use the Vercel CLI with your token to force a deployment.

Platform Deep Dives

Vercel

Vercel hosts the website. The project is named "site" under the team "dale-donovans-projects". It is connected to GitHub on the master branch — any push triggers a new deployment. The live URL is `site-theta-hazel.vercel.app`. To manually redeploy, Claude runs:

```
cd "C:/Users/daled/Ornate Christmas Lighting/site" && npx vercel --prod --yes --token YOUR_TOKEN
```

Vercel project ID: `prj_UuPk14MNijQDY2VWRjb6aDG66ATE`

Team ID: `team_7O0XT5egezbiBAcbOTI3x3Bj`

The Vercel API token is stored in `.mcp.json` in the project root. Do not share it publicly.

Supabase

Supabase provides the admin login at `/admin/index.html`. Project ID: `ebhwujdnrumixcbxaiqv`. To add admin users: go to `supabase.com`, open the project, go to Authentication → Users → Add User. The admin dashboard at `/admin/dashboard.html` is only accessible after a successful login.

Antigravity

Antigravity is a VS Code extension that made the very first Vercel deployment. It is no longer needed now that GitHub is connected to Vercel. It can be ignored.

Claude Code and the Vercel MCP

Claude Code is the AI assistant inside VS Code. It edits code, runs terminal commands, and deploys to Vercel. The Vercel MCP server lets Claude call the Vercel API directly. Config file location:

```
C:\Users\daled\Ornate Christmas Lighting\.mcp.json
```

If Claude loses the Vercel MCP connection, restart VS Code. The MCP uses the package @robinson_ai_systems/vercel-mcp with the VERCEL_TOKEN env var.

Key Files and Folders

site/index.html — Homepage

site/services.html — Services page

site/gallery.html — Gallery page

site/quote.html — Quote request form

site/css/style.css — All styles and design

site/assets/images/ — All images including logo files

site/admin/index.html — Admin login page

site/admin/dashboard.html — Admin dashboard (requires login)

site/admin/setup.sql — Supabase database setup script

.mcp.json — Vercel MCP config — contains API token

Quick Reference for AI Assistants

If you are an AI assistant reading this: the website is a static HTML/CSS site with no build step. Edit files in site/, commit with git, and push to origin master. Vercel will auto-deploy via the GitHub integration. If auto-deploy fails, use the Vercel CLI directly with the token stored in .mcp.json. Admin authentication is handled by Supabase (project ID: ebhwujdnrumixcbxaiqv). Do not modify setup.sql unless restructuring the database schema. Vercel project ID: prj_UuPk14MNijQDY2VWRjb6aDG66ATE. Team ID: team_7O0XT5egezbiBAcbOTI3x3Bj. GitHub repo: github.com/daledonovan/ornate-christmas-lighting.
